

4 types of body tissues:

List the ways cells can be held together in tissues (discussed in class):

Epithelial tissue

Characteristics:

2 names (1st and 2nd)

Epithelial tissue	Picture	Function	Notes
<u>Simple Squamous Epithelium</u>			
<u>Simple cuboidal epithelium</u>			
<u>Nonciliated Simple Columnar Epithelium</u>			
<u>Ciliated Simple Columnar Epithelium</u>			
<u>Nonciliated</u>			

<u>Pseudostratified Columnar Epithelium</u>			
<u>Ciliated Pseudostratified Columnar Epithelium</u>			

Stratified epithelial tissue	Picture	Function	Notes
<u>Stratified squamous epithelium</u>			
<u>Stratified cuboidal epithelium</u>			
<u>Stratified columnar epithelium</u>			

Transitional Epithelium	Picture	Function	Notes
<u>Transitional epithelium</u>			

Glandular epithelium is classified by:

Endocrine

Picture	Function	Notes

Exocrine

Picture	Function	Notes

Cells of the Connective tissue:

Cell type	Function/Characteristics

Key functions of connective tissue:

4 Classes of connective tissue:

Tissue class/example	Image	Subclasses	Cells	General Features
Connective Tissue Proper				
Cartilage				
Bone				
Blood				

Extracellular matrix:

Characteristics:

Composed of:	Components	Function(s)		
Fibers				
Ground substance				

Muscle Tissue

Tissue type	Image	Voluntary/Involuntary	Characteristics

Nervous Tissue:

Kinds of Cells	Function	Location

2 Types of Body Membranes:

Epithelial membranes

Examples	Description/location/function
Mucous	
Serous	
cutaneous	

Synovial membranes:

Where found	Description

Tissue repair:
